Press Report

No chance for malware

Anti-virus protection is especially important in the daily handling of diverse data that is processed at different places. The danger of receiving files with hidden viruses is imminent. The risk that malware is circulated is already immensely high, while uploading files into a secured system. If this data is then made available as a download on a large scale, e.g. after a company seminar, the hidden malware can spread rapidly and cause enormous harm. If the virus is capable of multiplying itself endlessly it can cause enormous damage once it has entered the system, e.g. it can reformat the hard drive or record and transmit videos undetectably via the webcam of the laptop. The damage that can be caused is huge, especially financially.

A good and reliable virus protection is vital. Avira is a leading provider of security solutions within the private and business sector. The German software company Dracoon cooperates with Avira in order to now also offer virus protection and therefore a complete security package.

All data that is viewed, edited or shared via Dracoon is already examined during the up- or download with the leading anti-malware. This way infected files can be detected and isolated immediately, therefore protecting companies from harm.

Marc Schieder, CIO of DRACCOON, welcomes the cooperation: "Avira is a first-class product that perfectly complements our cloud storage DRACCOON. The ICAP server with SAVAPI enables you to scan files with the award-winning malware detection system that is shared or received through DRACCOON. This double security guarantees our customers that they are reliably protected against malware and threats".
